Installing Remote Support

Remote Support is a small program that lets your IT support team see your screen and fix problems for you, without a visit. Installing it takes about two minutes.

Before you start

- Your IT support provider emails you a download link. Only install from a link they sent you.
- You may be asked for the password you use to sign in to this computer.
- You only need to do this once per computer.

On a Windows PC

1 Open the link and download the installer

Click the link in the email. The page picks the right version for your computer and marks it **Recommended**. Click it to download.

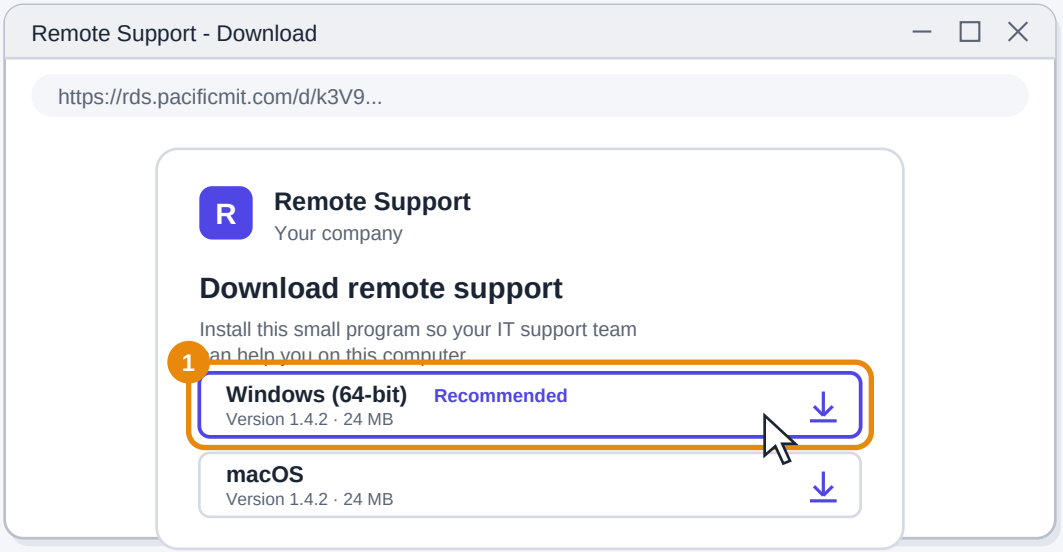

Illustration. Your screen may look slightly different.

2 Open the downloaded file

Open your **Downloads** folder, or click the file at the bottom or top of your browser.

If a blue **Windows protected your PC** window appears, click **More info** (1), then **Run anyway** (2). This is normal for programs your IT provider builds for you.

3 Allow the app to make changes

Windows asks whether to allow the app to make changes to your device. Click **Yes** (3). The installation then finishes on its own, usually in under a minute.

4 You're done

A **Remote Support** shortcut appears on your desktop and the app starts with Windows. There is nothing to set up. Your IT support team can now see this computer in their list.

On a Mac

1 Download the installer

Click the link in the email and choose **macOS**. A file ending in **.command** is saved to your Downloads folder.

2 Open it with a right-click

In Finder, open **Downloads**. Right-click (or Control-click) the file and choose **Open** (1). When the warning appears, click **Open** (2).

On macOS 15 or later, if there is no Open button: click **Done**, open **System Settings** → **Privacy & Security**, scroll down and click **Open Anyway**.

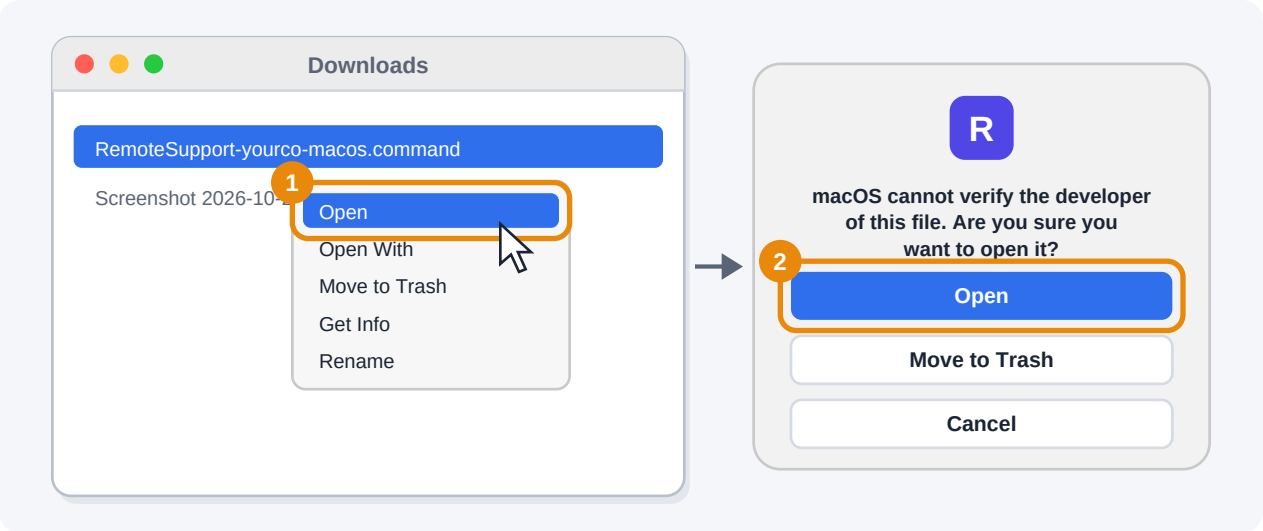

Illustration. Your screen may look slightly different.

3 Let the installer run

A Terminal window opens and shows its progress. When you see **installed and configured** (3), the app opens by itself and you can close the Terminal window.

4 Allow screen sharing and control

The first time it runs, macOS asks to let RustDesk record the screen and control the computer. Without these, your technician sees a blank screen or can't move the mouse.

Open **System Settings** → **Privacy & Security**. Turn on **RustDesk** under **Screen & System Audio Recording** (4) and under **Accessibility** (5). If macOS asks to quit and reopen RustDesk, click **Quit & Reopen**.

On Linux

Download the Linux installer from the link, open a terminal in your Downloads folder and run `sudo bash ./file-name.sh`, using the name of the file you downloaded. Enter your password when asked.

If something goes wrong

If this happens	Try this
The link says it is no longer available	Links can expire or be used a limited number of times. Ask your IT support provider for a new one.
Windows says the app is blocked and there is no Run anyway button	Your computer's security settings don't allow new apps. Contact your IT support provider.
The Mac says the file can't be opened	Use right-click → Open instead of double-clicking, or use Open Anyway in Privacy & Security (step 2).
The technician sees a black screen on a Mac	Screen recording isn't allowed yet. Repeat step 4, then quit and reopen RustDesk.
